If A is a matrix of $m \times n$ and B is a matrix of $n \times p$ then their product matrix $C=(A*B)$ will be $m \times p$, whose elements are produced by the dot product of a corresponding row of A and a corresponding column of B. The above image gives us a better understanding of multiplication of matrices. Applications of Matrices in Various Fields

Application Of Matrices in Various Fields (Matrix Operations)

A matrix is a convenient and useful way of representing a graph to a computer. Matrices lend themselves easily to mechanical manipulations. Besides, many known results of matrix algebra can be readily applied to study the structural properties of graphs from an algebraic point of view.

Each matrix element (d_{jk}) of the duty cycle matrix T of the matrix converter is represented for the duty ratio of the applied switches. For example, d_{Aa} , d_{Ab} , and d_{Ac} are represented for the turn-on time ratio of replied switches S_{Aa} , S_{Ab} , and S_{Ac} during one switching period. Additionally, each switch is turned on for the calculated time through the three portions of the time in one ...
