Evoked Potentials In Clinical Medicine

Coverage includes new clinical applications for evoked potential (EP) tests, advanced test variations such as motor and cognitive EPs, and new techniques that improve the efficiency of testing. Step-by-step instruction is provided on methodology and interpretation for each major test -- pattern-shift visual, brainstem auditory, and short-latency somatosensory.

Evoked potentials measure function, whereas imaging methods describe structure. Nevertheless, evoked potentials are underused in the diagnosis of disorders of the central nervous system. Evoked potentials also have the advantage of being far less expensive than imaging techniques.

The latter has served to focus the clinical application of evoked potentials, which still provide a temporal resolution greater than modern imaging techniques. In combination with medicolegal pressures in the United States, the use of intraoperative monitoring has also grown.

Evoked potentials (EPs) are time-locked responses of the nervous system to external stimuli. Somatosensory evoked potentials (SEPs) are one type of EP, which are generated by stimulation of afferent peripheral nerve fibers elicited by electrical, tactile, or other stimuli.

Neuro-electric responses to sensory stimuli can be readily and non-invasively recorded using averaging techniques first employed by Dawson in 1947. 1 The evoked responses can be quantified by measuring peak amplitudes and latencies, in the millisecond (ms) domain, and they provide numerical data that are quantitative extensions of the neurological examination.

Somatosensory evoked potentials (SEPs) provide a non-invasive, sensitive, and quantitative way of assessing the functional integrity of the peripheral and central proprioceptive, dorsal column-medial lemniscus somatosensory conduction pathways.

Evoked Potentials - Oxford Medicine

Sensory evoked potentials (SEP) are recorded from the central nervous system following stimulation of sense organs, for example, visual evoked

potentials elicited by a flashing light or changing pattern on a monitor, auditory evoked potentials by a click or tone stimulus presented through earphones), or tactile or somatosensory evoked potential (SSEP) elicited by tactile or electrical stimulation of a sensory or mixed nerve in the periphery.
