3.Working principle of the die. The fine blanking machine is special equipment for realizing the fine blanking process. As shown in below figure, there are three kinds of forces (P S, P R, P G) acting on the die during fine blanking.. Before the start of punching through the ring force P R, through the shear line outside the guide plate (6), so that the V-shaped gear ring (8) pressed into the ...

A typical compound fine blanking press includes a hardened die punch (male), the hardened blanking die (female), and a guide plate of similar shape/size to the blanking die. The guide plate is the first applied to the material, impinging the material with a sharp protrusion or stinger around the perimeter of the die opening.

Fineblanking - Swiss Tech Precision

Think of the GRIPflow process as similar to compound blanking. However, unlike a compound blanking operation, GRIPflow uses very small cutting clearances between each of the cutting components. This small clearance, combined with high blank holding pressures and precision clearances between all moving components, produces a smooth-edged part that can be held to very tight dimensional ...

Die Basics 101: Fineblanking and GRIPflow

Fineblanking is much like a cold extruding process. The slug (or part) is pushed or extruded out of the strip while it is held very tightly between the high-pressure holding plates and pads. The tight hold of the high-pressure plates prevents the metal from bulging or plastically deforming during the extrusion process.

Die Science: The process of fineblanking

Our 20 fine-blanking presses with total force ranging from 1,000 to 10,000 kN can process strip steel and non-ferrous metal up to 20 mm thick and 450 mm wide. By the complete-blanking-die production method, the components are produced in one single

Innovation opens up new prospects for fine-blanking. Innovation is Feintool's way of rolling back the frontiers of fineblanking. Our goal of continuing to develop fineblanking technology is also our motivation. Innovation and smart ideas for developing presses, tools and tool materials or for design-ing blanking processes ensure that the scope

ACHIEVING SUCCESS WITH FINEBLANKING

Fine blanking is a high precision metal forming process used in the automotive, heavy duty, electronics, medical, lawn and garden, and general industries. In fine blanking, the strip is held securely by the blank holder (guide-plate with V ring) which forces the metal sheet to stay completely flat while the part is being cut.

Fine blanking may be used to manufacture bevels, multiple, and complex gear sets which are difficult to produce by stamping. Gears made by fine blanking possess excellent dimensional accuracy and surface finish and have comparatively higher strength than those made by stamping and powder metallurgy. Fine-blanked gears have widespread applications including automotive,
