them wherever you are now.

Better to search instead for a particular book title, author, or synopsis. The Advanced Search lets you narrow the results by language and file extension (e.g. PDF, EPUB, MOBI, DOC, etc).

### **How Animals See Other Visions**

Excellent vision from eight pairs of eyes helps these spiders hunt. When they spot potential prey, they pounce. Their biggest pair of eyes face forward and give the spider high-resolution vision. The other, smaller eyes are used for peripheral vision and detecting motion. Jumping spiders can see a broader spectrum of colours than we can.

### **How do other animals see the world? | Natural History Museum**

This book is literally about how animals see. It shows you how

...

The eyes of most mammals and birds are organized in a similar way. If you examine the retina under a microscope, you can determine whether they contain cones for daytime vision and rods for nighttime vision. You can also look for special structures like the reflective surface cats have that enhances their night time vision.

Spiders and many insects can see a type of light called ultraviolet that most humans cannot see. Other animals, like snakes, are able to see infrared light. You can use the chart below to explore what colors certain animals see and how they compare to human color vision.

## **Colors Animals See | Ask A Biologist**

Human vision is among the sharpest of all animals, thanks to densely packed cones at the center of our retina. Nilsson says cats' daylight vision is about six times blurrier than ours, which is not depicted in the image above. However, cats have more rods than humans, so by moonlight, the advantage is reversed.

Horses, like dogs, cannot perceive the difference between red and green. They also have a similar rate of vision to a dog, at 20/60. Horses, like most flight animals, boast an impressive 350 degrees of monocular vision. This is due to the position of their eyes on the side of their head and allow them to see almost all the way behind themselves.
