The maximum operating pressure is taken a 1.7 bar above normal operation. for example, the design pressure of a vessel that normal operates at 0-0.69 bar and 95-540 °C is 2.76 barg (Turton et al., 2012).

A pressure vessel is a closed leak-tight container (normally cylindrical or spherical) designed to hold fluids (i.e, gases or liquids) at a pressure substantially different (higher or lower) from the ambient pressure. They are usually made from carbon steel or stainless steel and assembled from plates by welding method.
