Web Audio Api Boris Smus

The Web Audio API is built around the concept of an audio context. The audio con- text is a directed graph of audio nodes that defines how the audio stream flows from its source (often an audio file) to its destination (often your speakers). As audio passes through each node, its properties can be modified or inspected.

Web Audio API [Book] - O'Reilly Online Learning

The Web Audio API automatically merges multiple sounds playing at once, essentially just adding the waveforms together. This can cause problems such as clipping, which we discuss in Clipping and Metering. This example adds some variety to AudioBuffers loaded from sound files.

Web Audio API

The Web Audio API does not use dB SPL, since the final volume of the sound depends on the OS gain and the speaker gain, and only deals with dBFS. The logarithmic definition of decibels correlates somewhat to the way our ears perceive loudness, but loudness is still a very subjective concept. Comparing the dB values of a sound and the same sound ...
